Amendments to the Specification are as follows:

Please amend the paragraph beginning on page 22, line 18 and ending on page 23, line 7 as follows:

The manner of operation when the tilting manipulation which rotates the manipulation knob 2 in the counterclockwise direction shown in Fig. 9 is also substantially equal, wherein in the process that the driver 4 which is pushed by the manipulation knob 2 descends, the second extension 15b is tilted while resiliently deforming the second resilient portion 15e using the third push switch 10c as a fulcrum and the distal end of the extension 15b makes the second push switch 10b perform the ON operation. Further, when the manipulation knob 2 is further tilted in this state, the second extension 15b is further tilted in a lying posture using the second push switch 10b as a fulcrum and hence, the second pushing force transmission portion 15ge pushes the bend 15c from above while resiliently deforming the first resilient portion 15d and hence, the third push switch 10c is made to perform the ON operation.
